0.1 EDA - Haberman's Survival Data

0.2 Assignment description

- Download Haberman Cancer Survival dataset from Kaggle. You may have to create a Kaggle account to donwload data. (https://www.kaggle.com/gilsousa/habermans-survival-dataset)
- Perform a similar analysis as above on this dataset with the following sections:
- High level statistics of the dataset: number of points, numer of features, number of classes, data-points per class.
- Explain our objective.
- Perform Univaraite analysis(PDF, CDF, Boxplot, Voilin plots) to understand which features are useful towards classification.
- Perform Bi-variate analysis (scatter plots, pair-plots) to see if combinations of features are useful in classification.
- Write your observations in english as crisply and unambigously as possible. Always quantify your results.

0.3 Dataset qualitive description

Dataset source: (a) Donor: Tjen-Sien Lim (limt@stat.wisc.edu) (b) Date: March 4, 1999

Features 1. Age of patient at time of operation (numerical) 2. Patient's year of operation (year - 1900, numerical) 3. Number of positive axillary nodes detected (numerical)

Axillary nodes drain lymph vessels from the lateral quadrants of the breast, and are clinically significant in breast cancer.

Classes * 1 (survived) = the patient survived 5 years or longer * 2 (died) = the patient died within 5 year

0 30 64 1 survived 1 30 62 3 survived 2 30 65 0 survived 3 31 59 2 survived 4 31 65 4 survived 5 33 58 10 survived 6 33 60 0 survived 8 34 66 9 died 9 34 58 30 survived 10 34 60 1 survived 11 34 61 10 survived 12 34 67 7 survived 13 34 60 0 survived 14 35 64 13 survived 15 35 63 0 survived 17 36 69 0 survived 18 37 60		age	operation_year	axillary_nodes	survival_status

0.3.1 1 High level statistics of the dataset

```
In [8]: print(haberman.columns)
    print(haberman.shape)
    # number of points: 306
    # number of features: 3
    # number of classes: 2

gb = haberman.groupby('survival_status')
    print(gb.count())

# data-points per class:
    # 1 (the patient survived 5 years or longer): 225
    # 2 (the patient died within 5 year): 81

Index(['age', 'operation_year', 'axillary_nodes', 'survival_status'], dtype='object')
(306, 4)
```

	age	operation_year	axillary_nodes
survival_status			
died	81	81	81
survived	225	225	225

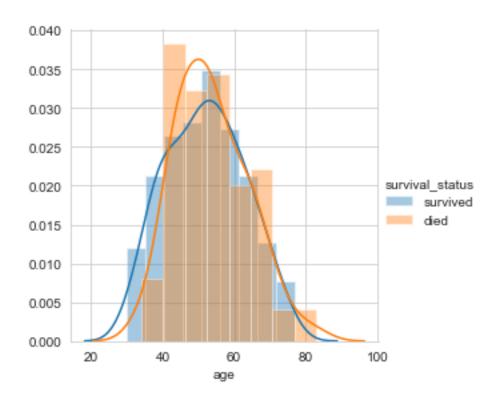

0.3.2 2 Objective

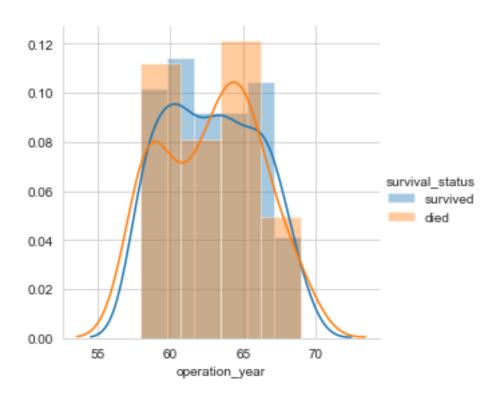

Classify a new patient that did a surgery for breast cancer as belonging to one of the 2 classes, given the 3 features described in the "Dataset qualitive description" section.

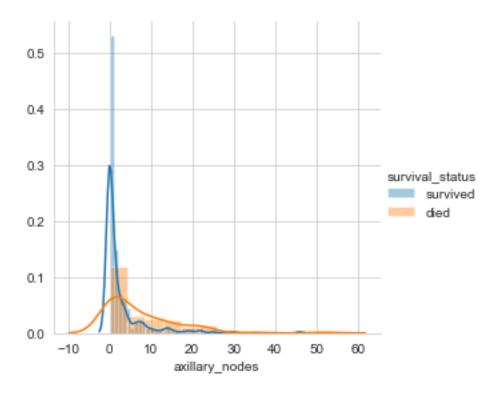

0.3.3 3 Univariate analysis

3.1 PDF

/Users/gustavo.fonseca/anaconda3/lib/python3.7/site-packages/scipy/stats/stats.py:1713: Future return np.add.reduce(sorted[indexer] * weights, axis=axis) / sumval

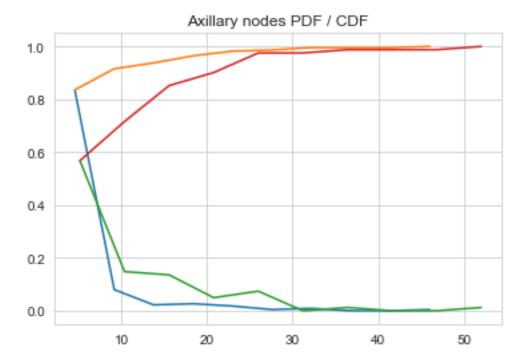

3.1.1 Observation(s) Age and Operation_year graphs: * They both assume a normal distribution; * Both of their classes overlap tremendously, therefore, they do not appear to be separable. Axillary_nodes graph: * It assumes a right skewed form; * Both classes overlap; * The PDF of the survived class is much higher in approx 0 axillary_nodes.

3.2 CDF Based on the PDF plot, age and operation_year do not appear as promising for univariate analysis as axillary_nodes. Hence, only the axillary nodes' CDF is plotted for further visualization and analysis.

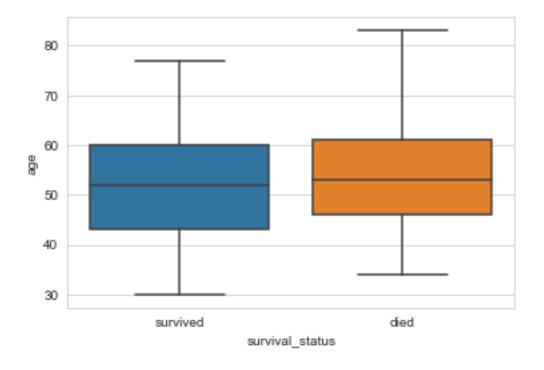

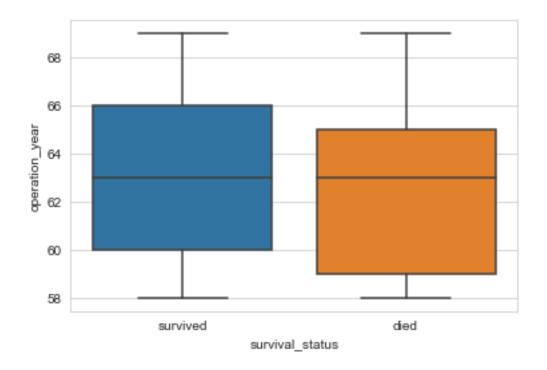

3.2.2 Observations

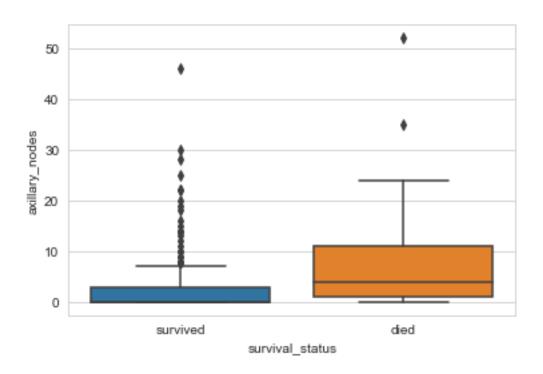

- At the 10 axillary nodes removal lies: approx 90% of all survivals and 70% of all non-survivals;
- With only one feature, it doens't seem to exist a basic model capable of separating both classes efficiently.

3.3 Box and Whiskers

```
plt.figure(2)
sns.boxplot(x='survival_status', y='operation_year', data=haberman)
plt.figure(3)
sns.boxplot(x='survival_status', y='axillary_nodes', data=haberman)
plt.show()
```

3.3.1 Observations Age graph: * Both classes have a very similiar median, ranging between 52 - 54; * Even though both classes' boxes are in a similiar range, older patients seem to die more frequently.

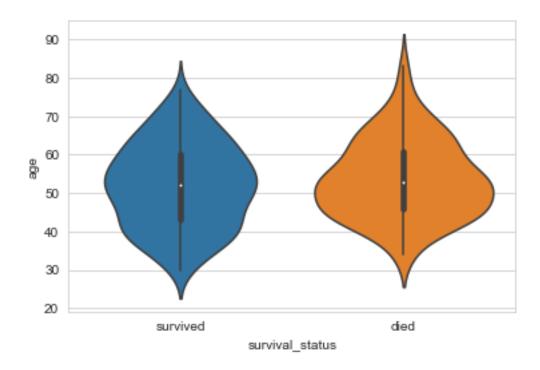

Operation year: * Both classes seem to have an identical median, approx 63; * Both classes lies in a similar range, but patients who have an older operation year, seem to die more frequently.

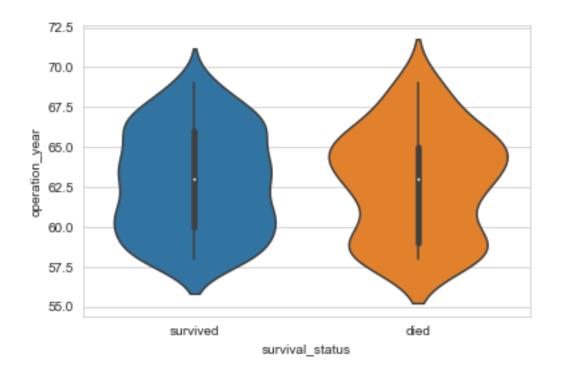

Axillary nodes: * There are a significant number of outliers; * It appears to be the most promising feature to reach the objective of this model; * Patients that remove less axillary_nodes appears to have a higher survival chance;

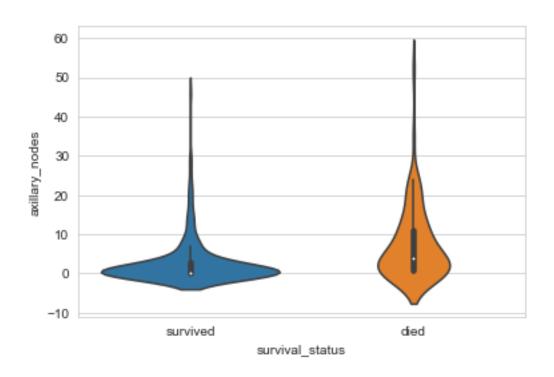

3.4 Violin

```
In [13]: plt.close()
    plt.figure(1)
    sns.violinplot(x="survival_status", y="age", data=haberman, size=8)
    plt.figure(2)
    sns.violinplot(x="survival_status", y="operation_year", data=haberman, size=8)
    plt.figure(3)
    sns.violinplot(x="survival_status", y="axillary_nodes", data=haberman, size=8)
    plt.show()
```

/Users/gustavo.fonseca/anaconda3/lib/python3.7/site-packages/scipy/stats/stats.py:1713: Future return np.add.reduce(sorted[indexer] * weights, axis=axis) / sumval

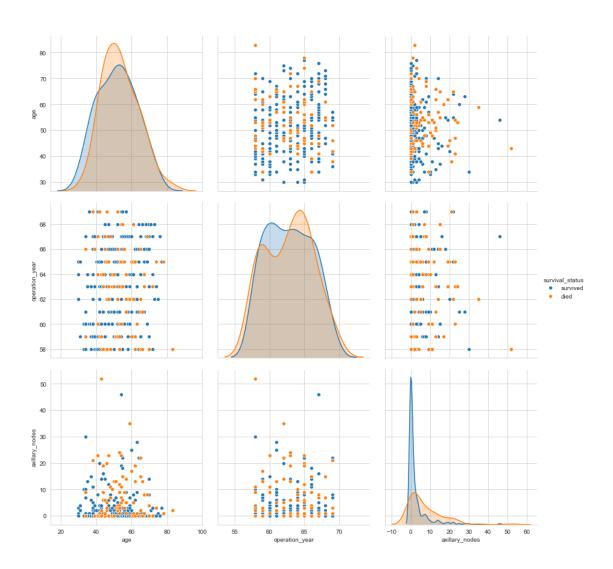

3.4.1 Observations

• The violin plot shows that patients that remove 0 axillary nodes have a high probability of survival.

0.3.4 4. Bivariate analysis

4.1 Pair plots

/Users/gustavo.fonseca/anaconda3/lib/python3.7/site-packages/scipy/stats/stats.py:1713: Future return np.add.reduce(sorted[indexer] * weights, axis=axis) / sumval

4. 2 Observations

- Apparently there is no pair of features that could linearly separate both classes effectively;
- The most promising feature for classification seems to be axillary_nodes;
- We can't build a simple model with 'if' and 'else' to separate both classes efficiently.
